

ON ROAD

**FPT**  
POWERTRAIN TECHNOLOGIES

# THE ROAD TO INNOVATION

Whatever you should move, either people or goods, FPT Industrial offers state-of-the-art powertrain solutions for On Road applications.

FPT Industrial engines are designed and manufactured for every kind of application from light, medium and heavy commercial vehicles to buses, allowing customers to completely rely on their cutting-edge technological contents and their reduced cost of ownership.

The presence of sophisticated electronic injection systems (third generation Common Rail), the choice of many air handling devices (Waste Gate, Variable Geometry and Two Stage Turbocharger) and the availability of Natural Gas versions make FPT Industrial engines for On Road applications the best solution offering excellent performance and a true respect for environment.

# FPT Industrial offers superior technology and outstanding advantages

## RUNNING COSTS REDUCTION

Low fuel consumption  
Best in class in maintenance intervals  
Passive DPF regeneration technology  
No vehicle downtime thanks to no DPF forced/parked regeneration  
Aftertreatment reliability thanks to more than 3 Millions of aftertreatment produced and more than 25 years of experience on SCR system

## PERFORMANCE

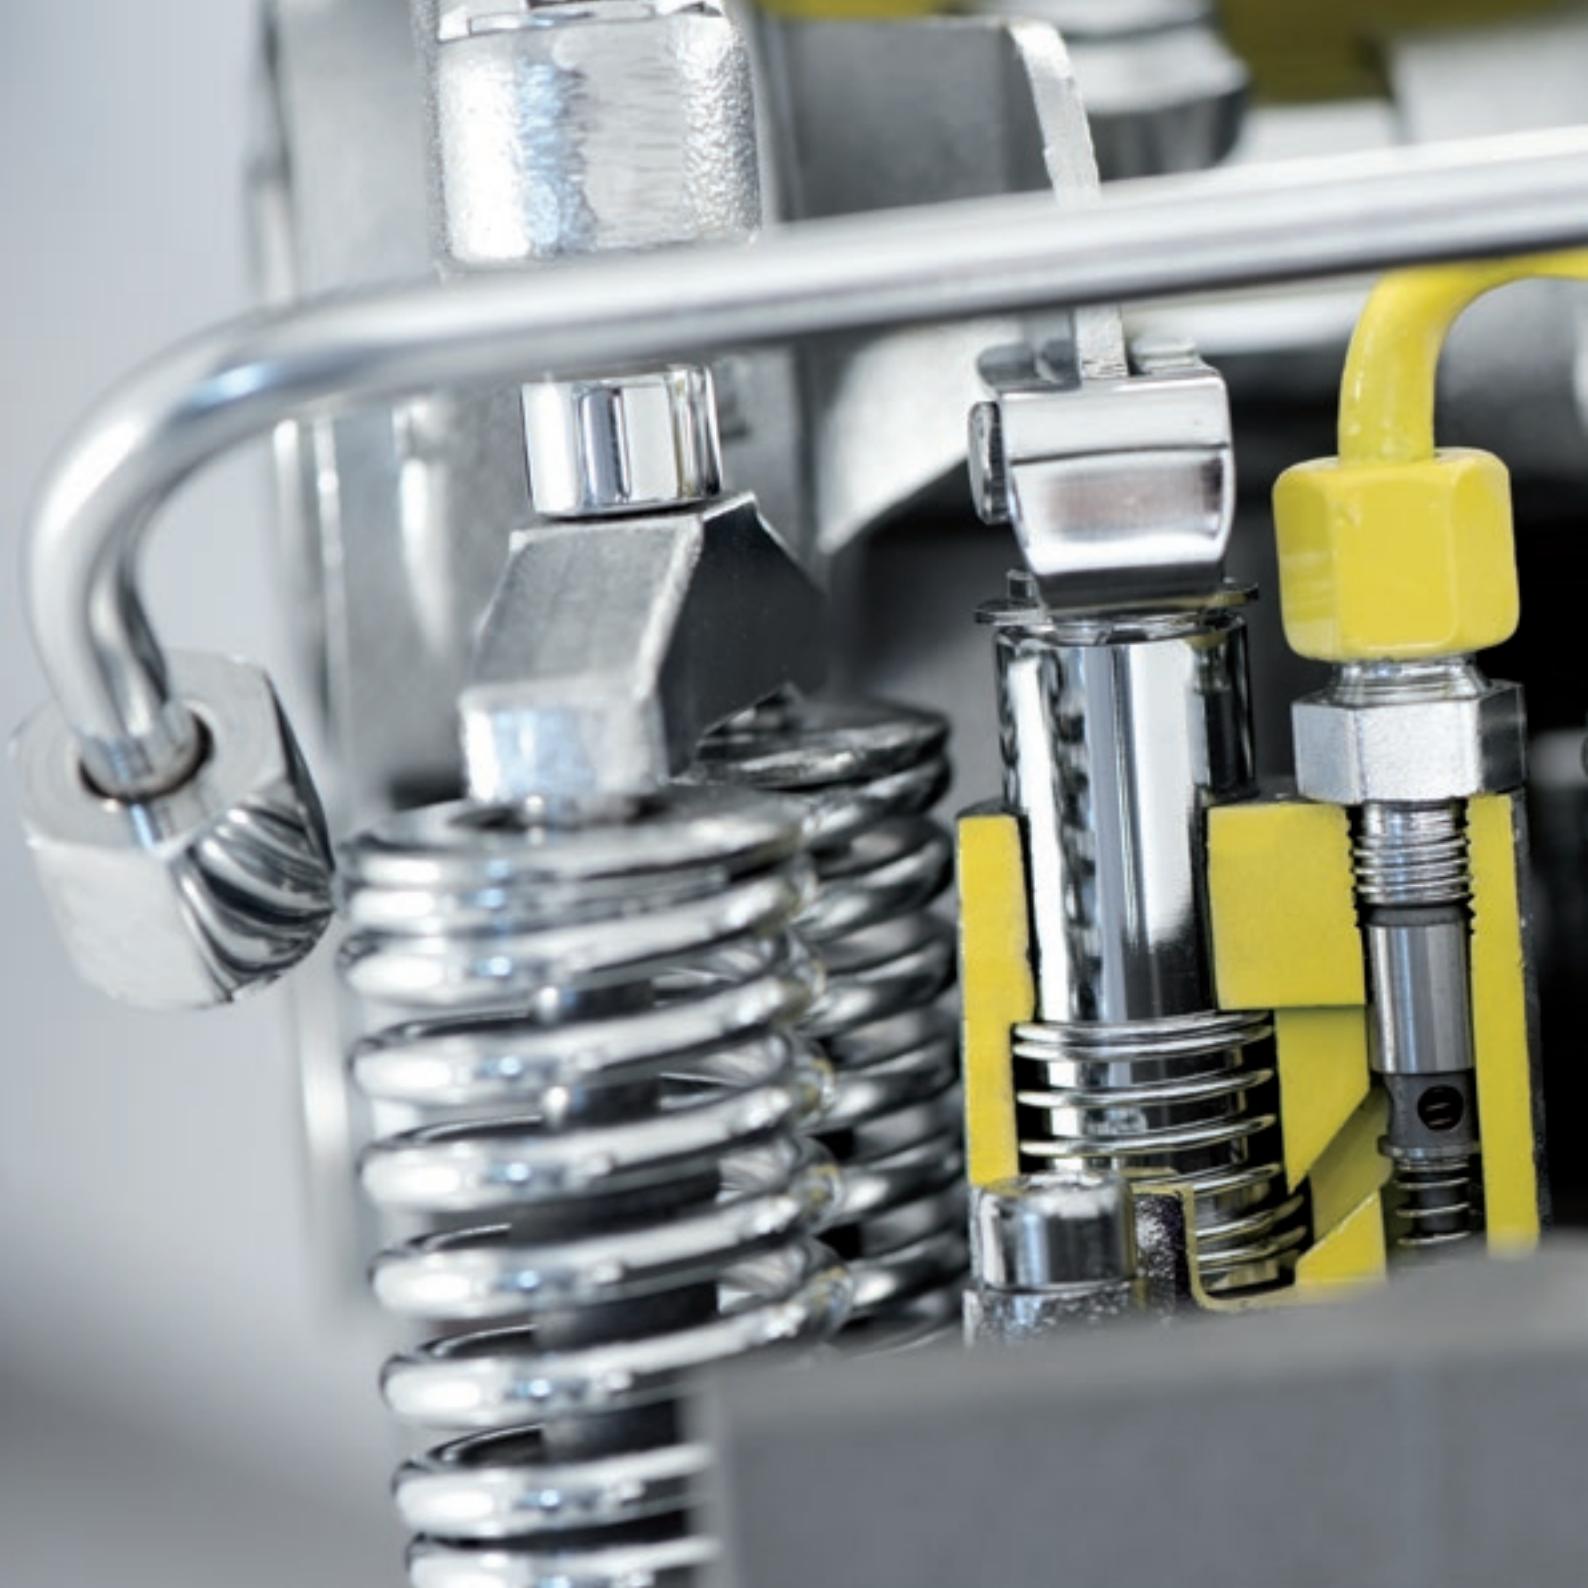

Power demand and torque response guaranteed in the most severe operating conditions for a wide range of applications  
State-of-the-art injection systems and turbocharging solutions for improved fuel economy  
Proven and break-through after-treatment technologies for emissions reduction and low operating costs

## RESPECT FOR THE ENVIRONMENT

Compliance with the most stringent emissions legislations  
The widest range of natural gas engines available on the market

## FLEXIBILITY

Availability of a wide range of options to create tailor-made products  
On request supply of interface components such as transmissions, radiators, air filters, silencers, aftertreatment system and cold start accessories  
Compact engine lay-out

# THE SOLUTION FOR THE FUTURE, TODAY

## SCR ONLY TECHNOLOGY FOR Euro VI step C

Technological excellence and product innovation for FPT Industrial represent the truly determining factor and part of its primary strategic mission. The company is focusing its research and development activities in order to become the innovation leader in the industrial powertrain field and a reference provider of the most cost-efficient powertrain solutions for Euro VI step C.

FPT Industrial aims to comply with the new emission limits ensuring a minimal impact on the vehicle architecture and the lowest possible increase in cost, an objective that will be achieved through HI-eSCR technology. The breakthrough patented technology, based on an experience of more than 25 years and 650.000 engines produced, allows our engines to meet Euro VI step C standards without resorting to EGR (Exhaust Gas Recirculation), guaranteeing a very high NO<sub>x</sub> conversion efficiency (over 95% versus 80-85% of best competitors).

# Scenario

During the combustion process, inside a Diesel engine, the chemical energy is transformed into a mechanical one. Because of the chemistry of combustion, several toxic substances are produced, of which the most harmful are Nitrogen Oxides ( $\text{NO}_x$ ) and Particulate Matter (PM).

The new Heavy Duty Euro VI step C exhaust emission regulations, which applied to all new heavy duty commercial vehicles and buses registered from 1st January 2017, introduce significant reductions in the On Board Diagnostic Threshold limits of these harmful pollutants:

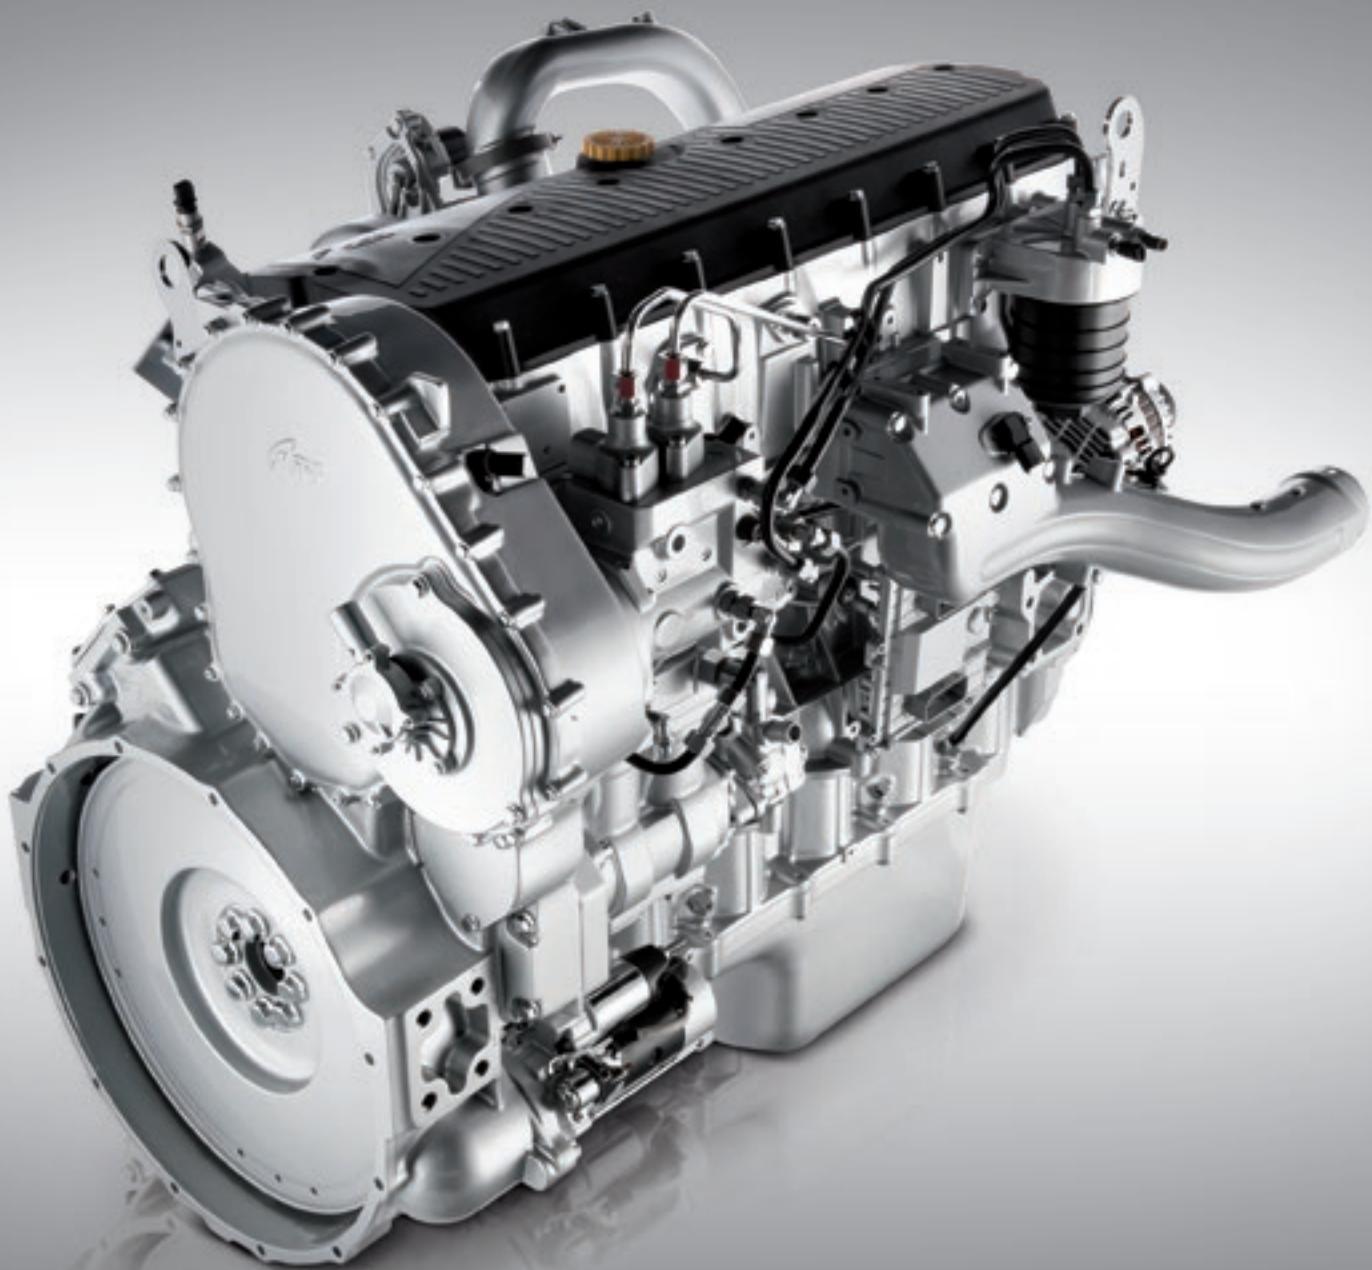

*More severe OBD Thresholds Limits (OTL) for Particulate Matter down to 25 mg/kWh that has to be demonstrated in field (instead of functional monitoring, allowed during step A)*

*Lower OBD Thresholds Limits (OTL) for NOx down to 1200 mg/kWh*

*Reagent consumption deviation: detection of 20% (Pending amendment back to 50%)*

*Urea quality must be detected against emission limits before the Emission Limit are exceeded; introduced to avoid tampering of the Reagent (incorrect quality or filling reagent tank with other liquids)*

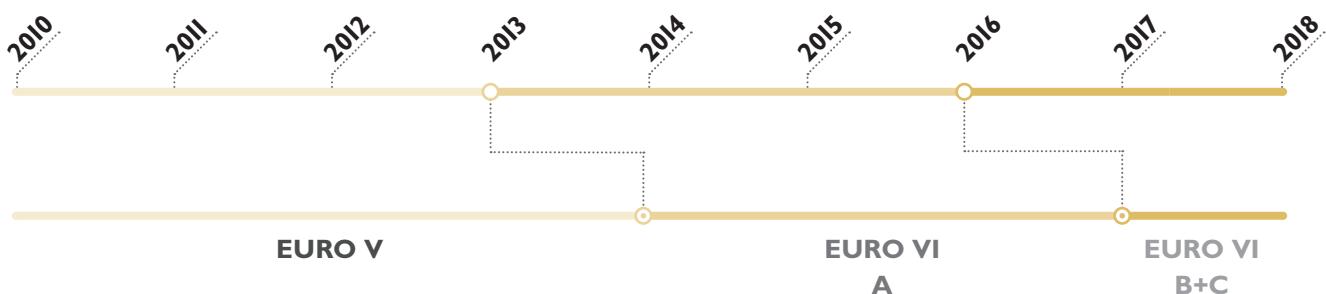

# Euro VI Step C

## Legal requirements and deadlines

Published on 13/06/2014 Postponement  
of Phase B for Diesel engines  
(integrated on Phase C)

Euro VI Step	NOx Limit (mg/kWh)	PM Limit (mg/kWh)	NOx OTL (*) (mg/kWh)	PM OTL (*) (mg/kWh)	EU Reagent quality (mg/kWh NOx) and Consumption Deviation (%)
A	460	10	1500	NA (**)	Reagent Quality NOx 900 CD 50%
B + C	460	10	1200	25	Reagent Quality NOx 460 = emission limit CD 20% (pending ECE approval back to 50%)

# Euro VI step C engines

Based on an already state of the art engine range, Euro VI step C maintains the same base engines hardware of Euro VI step A, allowing our customers to retain their class leading features, such as minimized Total Cost of Ownership. Key to the optimization of combustion efficiency is high mean effective cylinder pressure and high injector nozzle pressures.

To achieve these aims, important changes to the crankcase and cylinder head design have already been made in Euro VI step A, resulting in an increase in structural rigidity and in swept volume. The engines fitted with the latest generation of multiple events Common Rail fuel injection equipment with peak nozzle pressures of up to 2200 bar. A Electronic Control Unit manage both engine parameters and accurate control of the after-treatment system. The Control Unit has been designed to optimize packaging and to fully integrate all engine, SCR and DPF (Diesel Particulate Filter) functions. For Cursor engines using the Variable Geometry Turbocharger, electronic control is used to optimize load response

at low engine speeds and to increase the effectiveness of the engine brake. In addition, all engines make use of the flap type engine brake valve in order to support the aftertreatment thermal management and to guarantee engine brake performance up to 518 kW @ 2600 rpm.

For the very best in environmental performance, the engines were equipped with closed circuit engine breathing systems even at Euro IV/V level and this feature is retained for Euro VI. By means of the optimized combustion regime, engine-out particulate emissions are very low, meaning that forced/parked regeneration of the DPF is not required, an important aspect in terms of fuel consumption and periodic servicing. In addition, since the engine only breathes clean filtered air, rather than recirculated exhaust gases, engine wear is maintained very low and oil change intervals are maintained high, with service intervals of up to 150.000 km without increased oil sump.

This too brings advantages in terms of operating costs and reduced down time for scheduled maintenance.

# Advantages

- ✓ Low operating costs thanks to fluids economy leadership
- ✓ Best in class vehicle uptime due to low engine wear and long maintenance intervals (up to 150.000km, depending on mission)
- ✓ Best in class on specific power and torque
- ✓ Engine and Hi-eSCR aftertreatment system compact and lean design assuring low total weight and easy installation

# HI-eSCR system

Due to the opposite reaction to combustion temperature, the reduction of either of the combustion products (NO<sub>x</sub> or PM) necessarily implies the increase of the other one. In order to further reduce NO<sub>x</sub>, as required by Euro VI step C, it is necessary to work on different combustion management and exhaust gas treatment system.

This means that Euro VI step C emission limits can be reached only through the use of SCR (Selective Catalytic Reduction), either with or without EGR. The use of an EGR system reduces the NO<sub>x</sub> emissions in the combustion chamber, through exhaust gas recirculation with a consequential increase in the production of particulate matter (PM) and a reduction in combustion efficiency. Furthermore, with high engine-out particulate emissions, a forced regeneration of the DPF is required.

FPT Industrial has chosen instead to increase the engine combustion efficiency to reduce the PM without using re-circulated exhaust gasses for medium and heavy duty engines. While the remaining PM is reduced in the passive DPF, the NO<sub>x</sub> is reduced in the SCR system, while improving fuel consumption, performance and reliability. FPT Industrial's HI-eSCR is able to reduce the NO<sub>x</sub> levels more than 95%.

The "SCR Only" technology sees the introduction of a new integrated approach that is the result of extensive research by FPT Industrial, research that has led to the creation of numerous significant patents.

# Patents

*“Closed” loop control to allow precise dosing of NO<sub>x</sub> and ammonia sensors to provide accurate info on the composition of exhaust gases and reduce the use of AdBlue*

*Adaptive AdBlue dosing system in order to cut the level of NO<sub>x</sub> emissions entering the SCR catalyst*

*Thermally insulated high turbulence mixing, to allow homogeneous hydrolysis of urea, creating correct distribution in exhaust gas flow*

*Improved exhaust gas temperature control to speed up SCR light-off in the cold part of emission cycle*

All the components of the exhaust after-treatment system are contained in a compact and fully enclosed structure thereby not impeding body building or chassis equipment mounting activities and minimizing the weight impact.

# Main Components

HI-eSCR main components are:

✓ *The Diesel Oxidation Catalyst (DOC)*

✓ *The Passive Diesel Particulate Filter (DPF)*

✓ *The AdBlue dosing module*

✓ *The AdBlue mixer*

✓ *The Selective Catalytic Reduction (SCR)*

✓ *The Clean Up Catalyst (CUC)*

The whole system is fitted with a network of integrated sensors to control the NO<sub>x</sub> and any excess of NH<sub>3</sub> (ammonia) emitted.

Exhaust gas flow coming from the engine enters the DOC, where NO is oxidised in NO<sub>2</sub>, which helps to reduce the PM in the subsequent passive DPF. The filter is automatically regenerated at lower temperatures compared to the active DPF used by our competitors. The ECU (Engine Control Unit), the brain behind the

HI-eSCR system, checks, through integrated sensors' network, the amount of Water-Urea (AdBlue) solution to be injected in the exhaust pipe. To increase the durability of the injector, Dosing Module is cooled by the engine coolant.

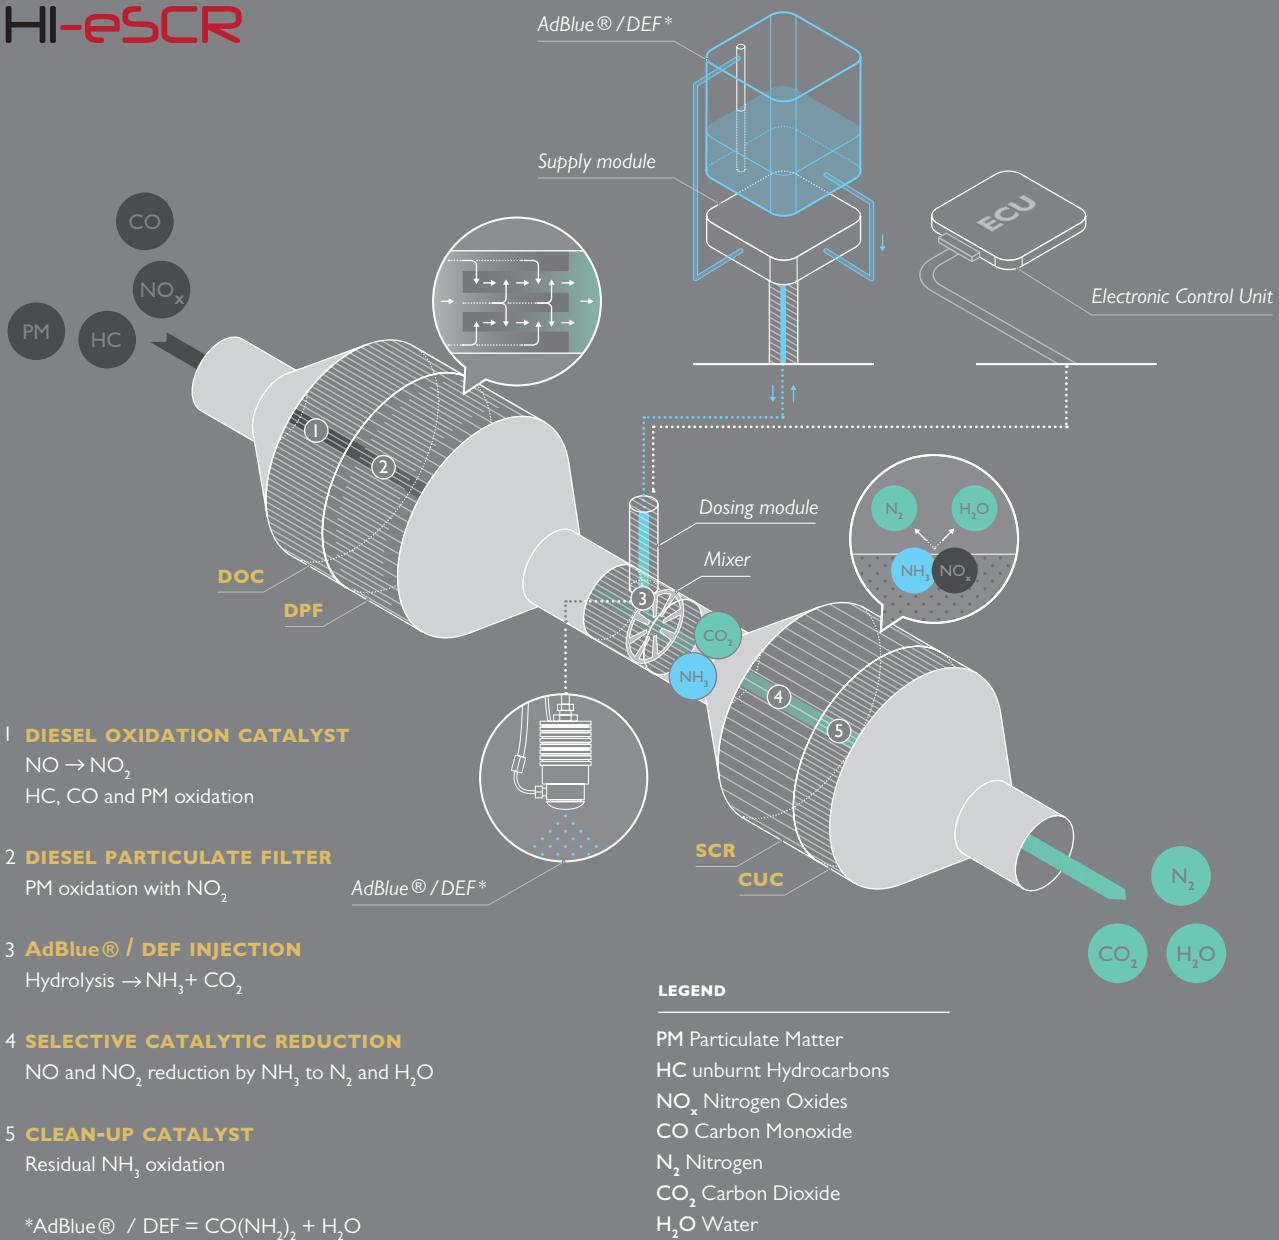

The HI-eSCR after-treatment system adopts a catalyst converting NO<sub>x</sub> into Nitrogen (N<sub>2</sub>) and Water (H<sub>2</sub>O) thanks to the chemical reaction with a Water-Urea solution. In the end, the integrated CUC eliminates the remaining ammonia (NH<sub>3</sub>). The result is a reduction of NO<sub>x</sub> superior to 95%.

Additional Euro VI step C new contents are:

- Particulate Matter sensor and new diagnostic SW to check the new OBD PM limits;
- High accuracy DPF Delta Pressure sensor to improve DPF efficiency monitoring;
- DOC with new coating specs and SCR volume increase to guarantee new OBD NOx limits without EGR;
- New Temperature sensor at DPF inlet improving DOC/DPF management;
- New Urea quality sensor in order to assure high reagent quality.

# Hi-eSCR

# Six reasons to choose HI-eSCR

## 1 SCR HERITAGE

FPT Industrial's heritage in SCR technology is well-established.

From the introduction of the Euro IV emission regulations in 2005 we have equipped more than 650.000 vehicles with this technology.

## 2 OUTSTANDING PERFORMANCE

Our engines are developed to maximize torque and power density with the shortest load response time, without compromising the impact on the environment, due to the use of the HI-eSCR system.

## 3 FUEL CONSUMPTION

The efficiency of the combustion process optimizes fuel consumption reducing customer running costs.

## 4 DPF PASSIVE REGENERATION

The absence of EGR improves engine efficiency and drastically reduces the outflow of particulate matter.

This allows for the use of a passive DPF, where forced/parked filter regeneration will not be necessary DPF filter replacement/cleaning for heavy duty applications is up to 600.000 km depending on the mission.

## 5 COMPACT PACKAGING

Compared to competitor's engines the thermodynamic efficiency of the FPT Industrial solutions allows to downsize displacement, not needing any additional cooling power, optimizing packaging space and minimizing weight.

## 6 MAINTENANCE INTERVALS

The optimized combustion process preserves oil physical properties reducing maintenance activities and related downtime.

The engines maintain their best in class oil maintenance intervals of up to 150.000 km depending on the mission, without an increased oil sump.

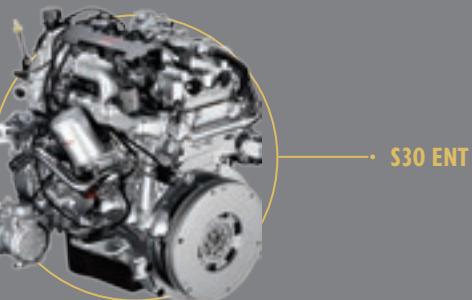

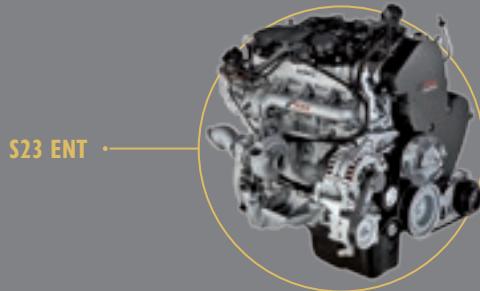

# The F1 Series

The F1 Series is the result of more than 35 years of experience in the field of light commercial vehicles. To deliver optimum efficiency and minimum oil consumption together with long service intervals, F1 engines feature the last generation Common Rail, four valves per cylinder, maintenance-free hydraulic valve and advanced air handling systems.

For this series, EGR (Exhaust Gas Recirculation) and SCR (Selective Catalytic Reduction) technology have been recognized as the best solution to make engines compliant with Euro VI standards.

For Euro 6 standard, there are 2 different solutions:  
Low Pressure EGR + NSC (NOx Storage Catalyst) to differentiate vs. price sensitive customers;  
High Pressure EGR + SCR to stay in the mainstream of the Total Cost of Ownership addicted customers.

The engines are available for both transversal and longitudinal installation in diesel and CNG/LNG versions.

# Features

## UP TO 50.000 KM

### OIL CHANGE INTERVALS

Functional engine design in terms of mechanical clearances, piston rings and engine oil system calculation.

## SPECIFIC FEATURES

F1 Series specifically developed for commercial vehicles; starting temperature with glow plugs down to -25°C. Performance achieved with external cooled EGR, FGT with Wastegate valve, VGT or Two Stage Turbocharger.

## ELECTRONIC INJECTION SYSTEM

Injection system based on Common Rail; state-of-the-art technology for accurate fuel delivering. A 3rd generation Common Rail System up to 2.000 bar for S30 to comply with Euro VI step C.

## AIR HANDLING

Two Stage Turbocharger (S30), VGT with air-to-air charge cooler air unit or FGT with Wastegate valve. 4 valves per cylinder to increase engine efficiency through the optimization of thermodynamic performance.

## ENGINE DESIGN

Dual mass flywheel, hydraulic tappets with roller finger followers, multiple fuel injection, suspended oil pan, bed-plate in addition to engine block, timing system driven by toothed belt for S23.

## COMPONENTS INTEGRATION

Integration of components such as patented CCV (Closed Crankcase Ventilation), oil cooler, oil, water and steering pumps.

## SERVICEABILITY & MAINTAINABILITY

Worldwide service network. Engine ECU (Electronic Control Unit) with CAN-BUS control and monitoring interfaces for advanced real time diagnosis.

## AFTERTREATMENT SYSTEM

External cooled EGR combined with SCR as the best solution for Euro VI step C on light duty engine's applications, where vehicle dimensions are a constraint and drivers' attitude towards fuel saving is not so relevant as in the heavy sector.

## OPTION LIST

Options for radiators, air filters, mufflers, air compressor, air conditioning compressor arrangement; both transversal and longitudinal versions available; both Diesel and natural gas versions available.

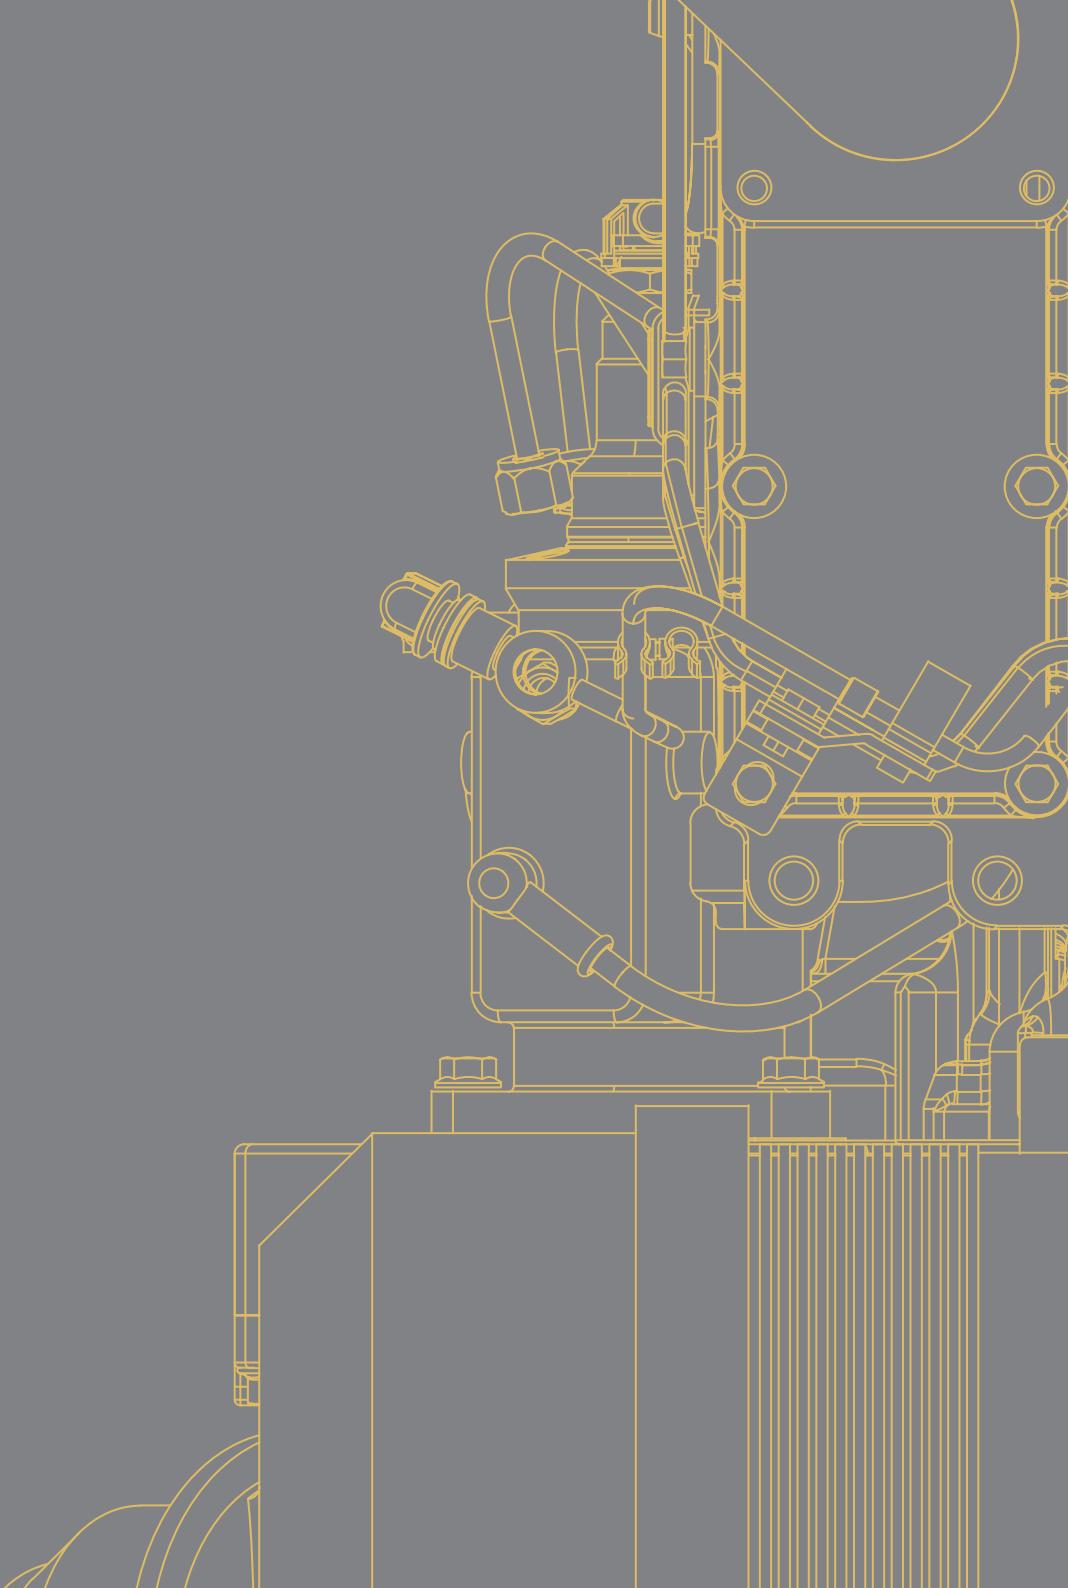

# Benefits

- ✓ REDUCED MAINTENANCE NEEDS AND OPERATING COSTS
- ✓ HIGH PERFORMANCE GUARANTEED IN ALL CONDITIONS
- ✓ TOP PERFORMANCE (LOAD RESPONSE, TORQUE, POWER) WITH THE MINIMUM FUEL CONSUMPTION
- ✓ HIGH POWER WITH THE SHORTEST TIME TO TORQUE AND LOW FUEL CONSUMPTION
- ✓ HIGH DURABILITY AND LOW NOISE & VIBRATION
- ✓ COMPACTNESS
- ✓ QUICK AND ACCURATE SERVICE SUPPORT AND REDUCED VEHICLE DOWNTIME
- ✓ HIGH RELIABILITY AND LOW RUNNING COSTS (FUEL CONSUMPTION, VEHICLE DOWNTIME)
- ✓ CUSTOMER ORIENTATION

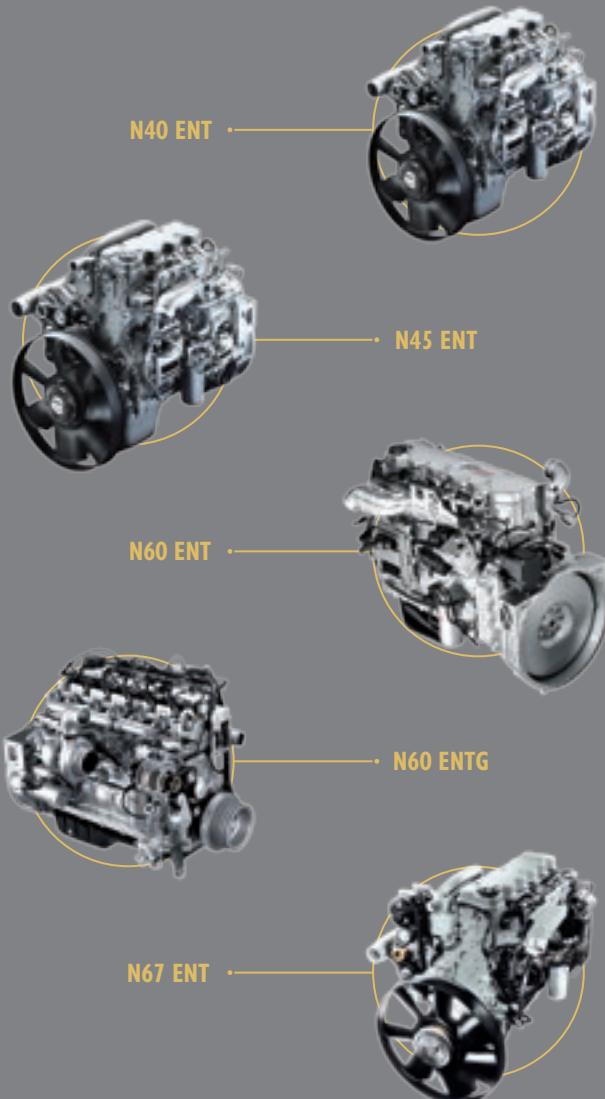

# THE NEF SERIES

# The NEF Series

Developed to satisfy the most demanding customers' requirements, the NEF Series is the evidence of FPT Industrial technological excellence. Compliant with Euro VI step C emissions standards, it is the compact, cost-effective and efficient engine solution in the 6 to 18 tons buses/coaches and trucks.

Available in 4 and 6 cylinders, with Diesel Common Rail or CNG/LNG multi-point injection system, the NEF Series stands out for its great reliability; furthermore, reduced fuel consumption and remarkable performance make these engines the reference of their category.

# Features

<b>UP TO 80.000 KM OIL CHANGE INTERVALS</b>	Long oil change intervals; functional engine design in terms of mechanical clearances, piston rings, engine oil system calculation.
<b>SPECIFIC FEATURES</b>	Lean lay-out; starting temperature with standard equipment auxiliaries down to $-25^{\circ}\text{C}$ (with optional water heater down to $-30^{\circ}\text{C}$ ); $25^{\circ}$ engine continuous inclination in all directions; high performance achieved without either EGR or VGT. Integration of exhaust flap for thermal management, increased brake performance and introduction of improved high-efficiency blow-by on Euro VI A/C engines.
<b>ELECTRONIC INJECTION SYSTEM</b>	Very compact 2nd generation HD Common Rail System for accurate fuel delivery; state-of-the-art system to optimize thermodynamic performance and achieve flat torque curve.
<b>AIR HANDLING</b>	Turbocharged with air-to-air aftercooler unit for the optimization of thermodynamic performance, without using Variable Geometry Turbocharger for Euro V & VI A/C emission limits achievement.
<b>ENGINE DESIGN</b>	Cast iron cylinder head, rear geartrain lay-out, camshaft in crankcase, suspended oil pan, bed-plate in addition to engine block.
<b>COMPONENTS INTEGRATION</b>	High components integration such as patented CCV (Closed Crankcase Ventilation), oil cooler, oil and water pumps.
<b>SERVICEABILITY &amp; MAINTAINABILITY</b>	Worldwide service network. Engine ECU (Electronic Control Unit) with CAN-BUS control and monitoring interfaces for advanced real time diagnosis.
<b>AFTERTREATMENT SYSTEM</b>	Hi-eSCR system is recognized as the best ATS solution for medium and heavy duty automotive engines to reach Euro VI A/C emission standards; it reduces $\text{NO}_x$ outside the engine, regardless the combustion process, enhancing engine performance and reliability, reducing at the same time fuel consumption and heat rejection.
<b>OPTION LIST</b>	Options for transmissions, radiators, air filters, mufflers; standard transmission interface SAE; air compressor, air conditioning compressor and steering pump arrangement; oil sump available for both truck and bus applications; available on both Diesel and natural gas versions.

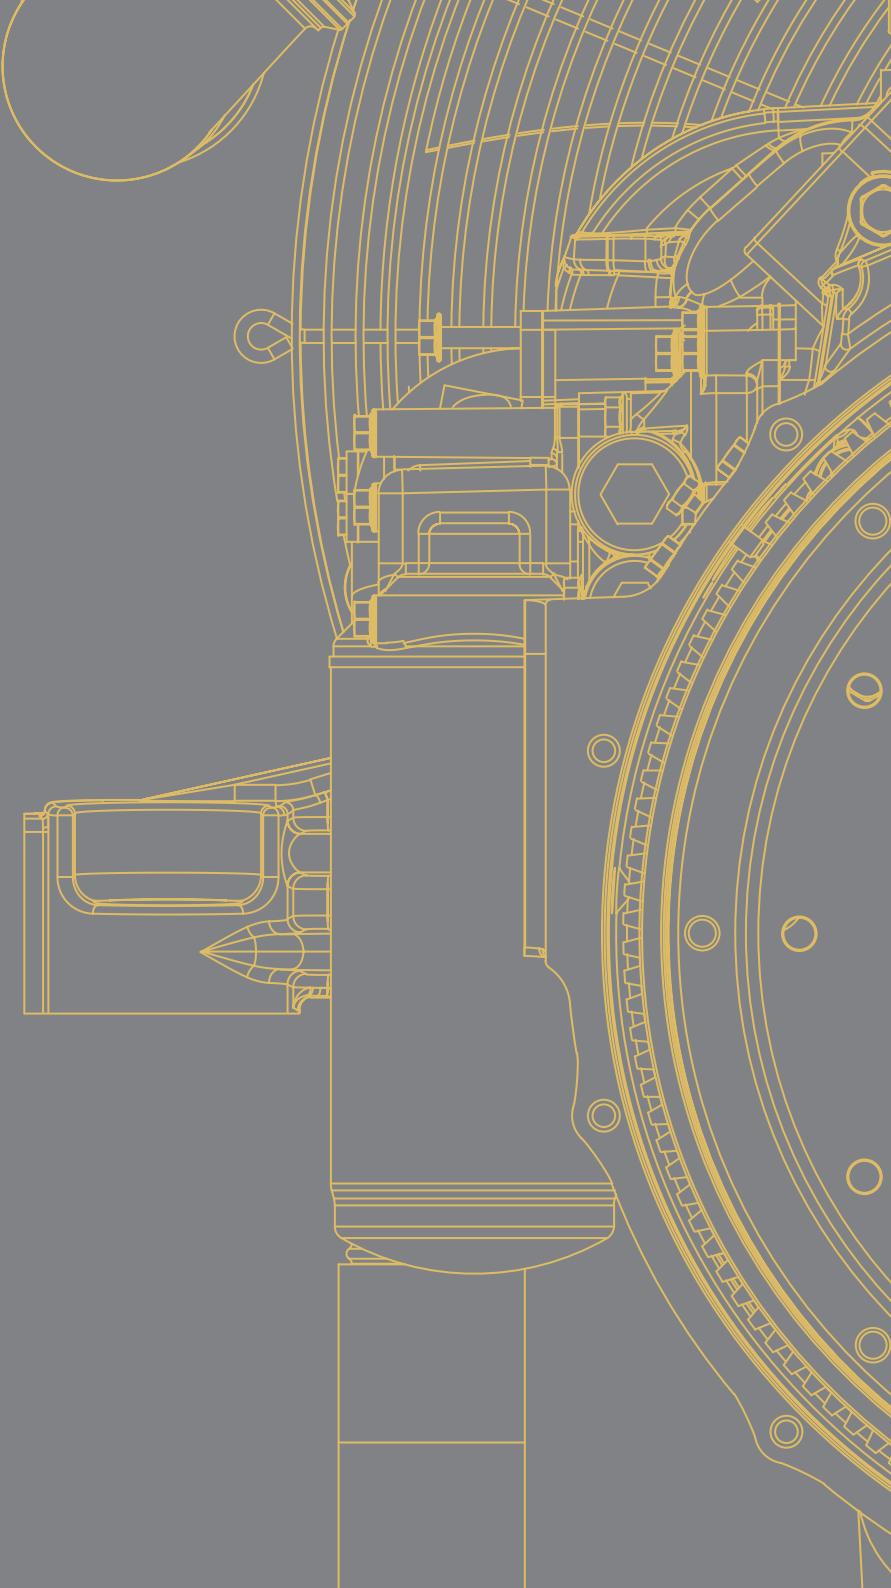

# Benefits

- ✓ REDUCED OPERATING COSTS
- ✓ TOP PERFORMANCE GUARANTEED IN ALL CONDITIONS
- ✓ HIGH PERFORMANCE (POWER, TORQUE, LOAD RESPONSE) WITH THE MINIMUM FUEL CONSUMPTION
- ✓ HIGH POWER WITH EXCELLENT LOAD RESPONSE AND LOW FUEL CONSUMPTION
- ✓ VIBRATIONS & NOISE REDUCTION
- ✓ COMPACTNESS
- ✓ QUICK AND ACCURATE SERVICE SUPPORT AND REDUCED VEHICLE DOWNTIME
- ✓ ENVIRONMENTAL CARE, HIGH RELIABILITY AND LOW RUNNING COSTS (FUEL CONSUMPTION, VEHICLE DOWNTIME)
- ✓ ENGINE VERSATILITY, CUSTOMER ORIENTATION

# THE CURSOR SERIES

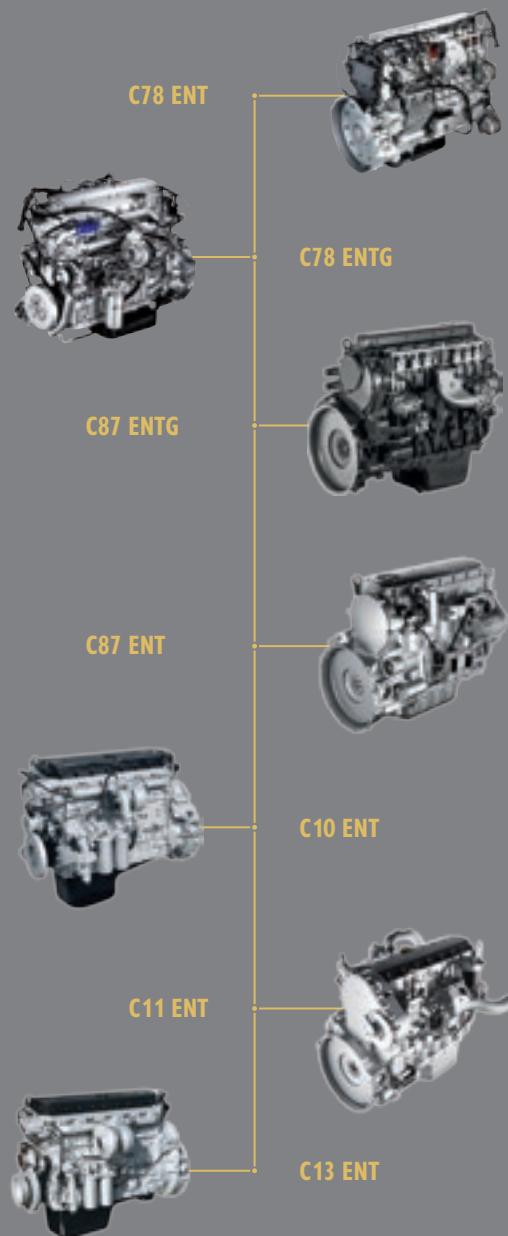

# The Cursor Series

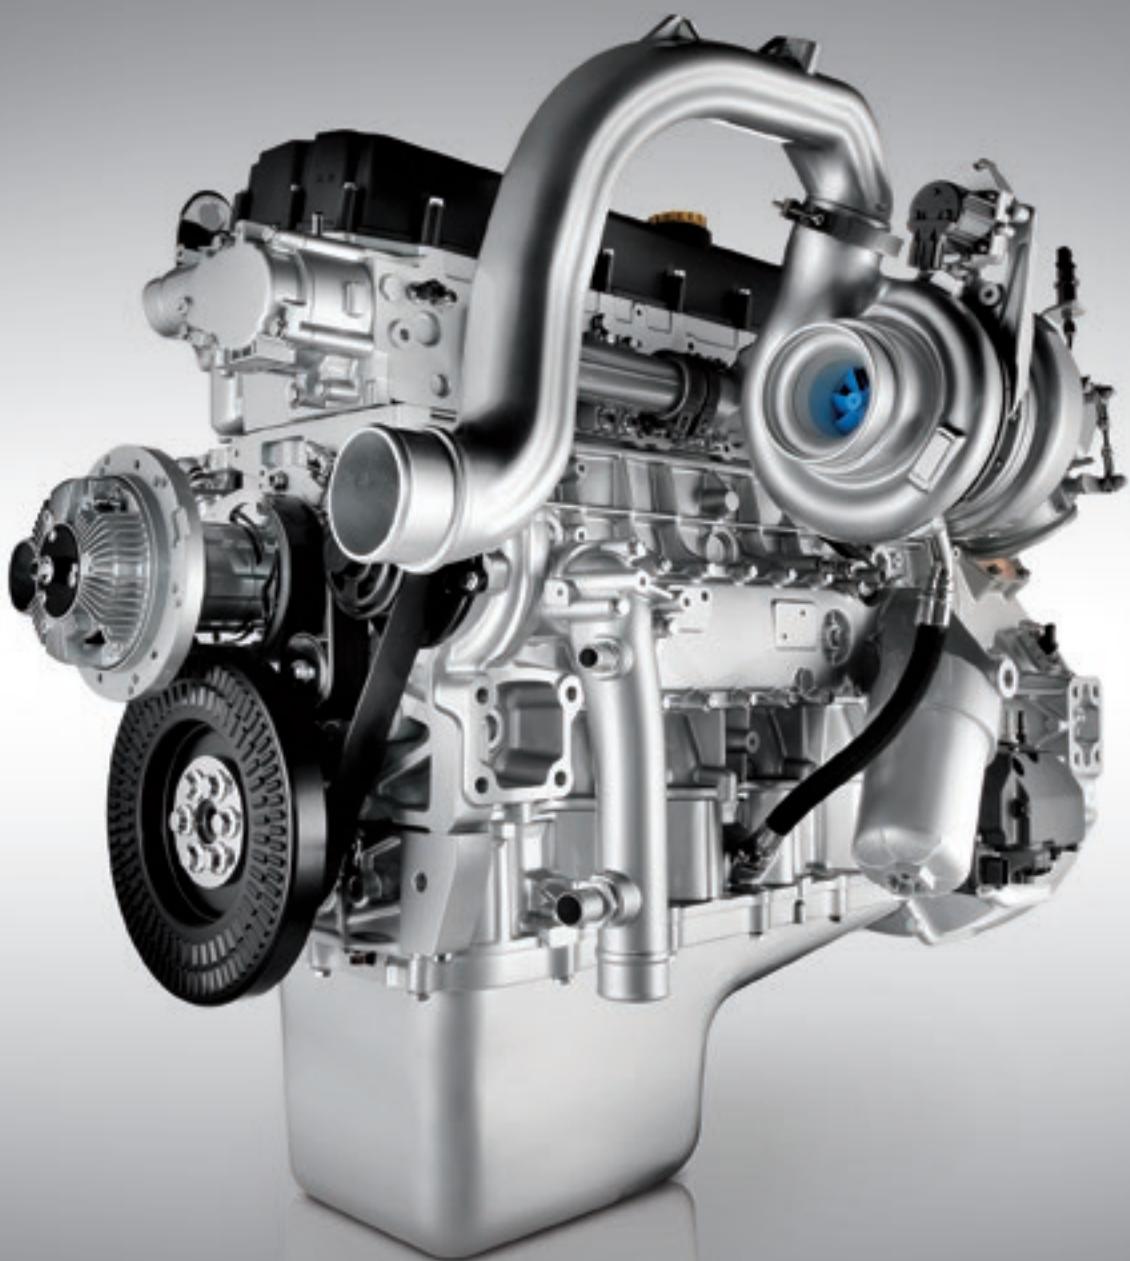

The Cursor Series engines are available in both Diesel and CNG/LNG versions, in a range from 180 to 420 kW and are compliant with Euro VI step C standard.

Thanks to their Electronic controlled Variable Geometry Turbocharger (EVGT), a high maximum torque is developed at low rpm and available over a wide rpm range. Cursor Series stands out for superb performance combined with an extremely low fuel consumption. Best in class intervals for oil changes (up to 150.000 km), DPF cleaning/replacement (up to 600.000 km) and oil consumption provide significant advantages in maintenance costs and vehicle down-time.

Thanks to the new Cursor 9 CNG/LNG introduction, FPT boosts the most powerful and silent CNG/LNG engine on the market and the broadest engine range, extending offer for long haul and distribution/municipality trucks and city/intercity buses, all based on common technology and proprietary engine control strategies

# Features

## UP TO 150.000 KM

### OIL CHANGE INTERVALS

Best in class for oil change intervals; functional engine design in terms of mechanical clearances, piston rings, green oil filters, low viscosity oils, engine oil system calculation.

## SPECIFIC FEATURES

Lean lay-out; starting temperature down to -25°C; performance achieved thanks to the Electronic Unit Injector and VGT without cooled EGR (neither internal nor external). Introduction of centrifugal blow-by on Euro VI A/C engines and electronic governed exhaust flap for increased engines brake power up to 30 %.

## ELECTRONIC INJECTION SYSTEM

Cursor Series feature 3rd generation common rail on Euro VI A/C engines and electronic controlled unit injectors on Euro IV/V engines. Designed to optimized fuel delivery they assure top power and torque.

## AIR HANDLING

VGT with air-to-air charge cooled air system with 4 valves per cylinder to increase engine efficiency through the optimization of thermodynamic performance.

## ENGINE BRAKE SYSTEM

The ECU controlled engine brake system reduces brake pad wear and consequent operation costs. Further introduction of an electronic governed exhaust flap on Euro VI A/C increases the engine brake power up to 30 %. Auto-engaging function increases driveability.

## ENGINE DESIGN

Super-finished helicoidal timing gears, high flexibility of injection system, bed-plate in addition to engine block, rear geartrain lay-out, suspended oil pan. Integrated Common Rail in cylinder head for Euro VI A/C (-1 dBA vs. Euro V electronic controlled unit injectors).

## COMPONENTS INTEGRATION

High components integration such as patented CCV (Closed Crankcase Ventilation), oil cooler, oil and water pumps.

## SERVICEABILITY & MAINTAINABILITY

Worldwide service network. Enhanced engine serviceability and diagnosis by mounting the Electronic Control Unit on the engine with CAN-BUS control and monitoring systems interface.

## AFTERTREATMENT SYSTEM

Hi-eSCR system is recognized as the best ATS solution for medium and heavy duty automotive engines to reach Euro VI A/C emission standards: it reduces NO<sub>x</sub> outside the engine, regardless the combustion process, enhancing engine performance and reliability, reducing at the same time fuel consumption and heat rejection.

## OPTION LIST

Oil sump available for both truck and bus applications; available on both Diesel and natural gas versions.

# Benefits

- ✓ REDUCED OPERATING COSTS
- ✓ HIGH PERFORMANCE GUARANTEED IN ALL CONDITIONS
- ✓ BEST IN CLASS
- ✓ HIGH ENGINE POWER DENSITY AND FAST LOAD RESPONSE TIME WITH THE LOWEST FUEL CONSUMPTION
- ✓ DRIVING COMFORT
- ✓ VIBRATIONS & NOISE REDUCTION
- ✓ COMPACTNESS
- ✓ QUICK AND ACCURATE SERVICE SUPPORT AND REDUCED VEHICLE DOWNTIME
- ✓ ENVIRONMENTAL CARE, HIGH RELIABILITY AND LOW RUNNING COSTS (FUEL CONSUMPTION, VEHICLE DOWNTIME)
- ✓ ENGINE VERSATILITY , CUSTOMER ORIENTATION

# CNG/LNG engines – Features

F1, NEF and CURSOR: the widest Natural Gas engine range on the market

## UP TO 70.000 KM OIL CHANGE INTERVALS

Functional engine design in terms of mechanical clearances, piston rings, chrome ceramic oil sealing and engine oil system calculation.

## INJECTION SYSTEM

Multipoint sequential injection is an indirect injection system that ensures an accurate fuel delivering process and very stable combustion avoiding backfire troubles resulting in competitive fuel economy and engine performance. Thanks to specific pistons, combustion is optimized and CNG/LNG burns readily and completely. Gas chemical composition quality doesn't affect combustion processes.

## COMBUSTION TECHNOLOGY

Stoichiometric combustion (air-fuel mixture in equal quantity), developed by FPT in 1995, continuously improved over the last 20 years and the only solution to comply with Euro VI step C emission levels, assures best in class fuel consumption and lower noise than Diesel engine.

## ENGINE DESIGN

Cast iron crankshaft with counterweights (F1), rear distribution (NEF & CURSOR) for better driving comfort.

## COMPRESSED NATURAL GAS FUEL

CNG/LNG is one of the cheapest fuel types. Strong economic advantages for the customer along the vehicle useful life.

## SERVICEABILITY & MAINTAINABILITY

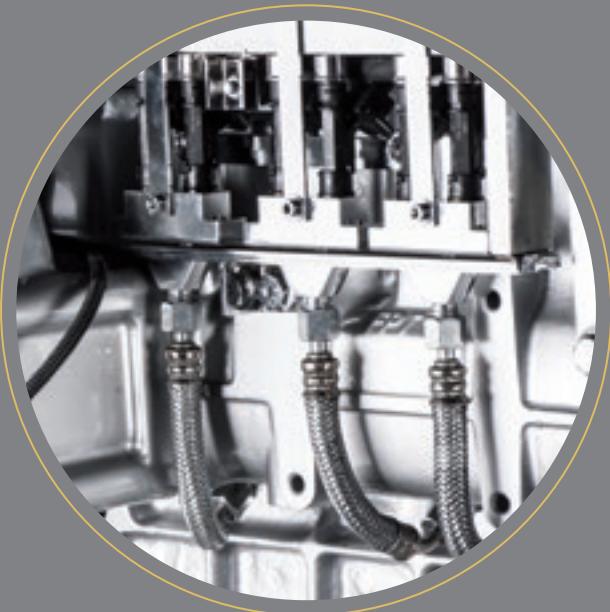

Worldwide service network. Engine ECU (Electronic Control Unit) with CAN-BUS control and monitoring interfaces for advanced real time diagnosis and efficient engine management.

## AFTER-TREATMENT SYSTEM

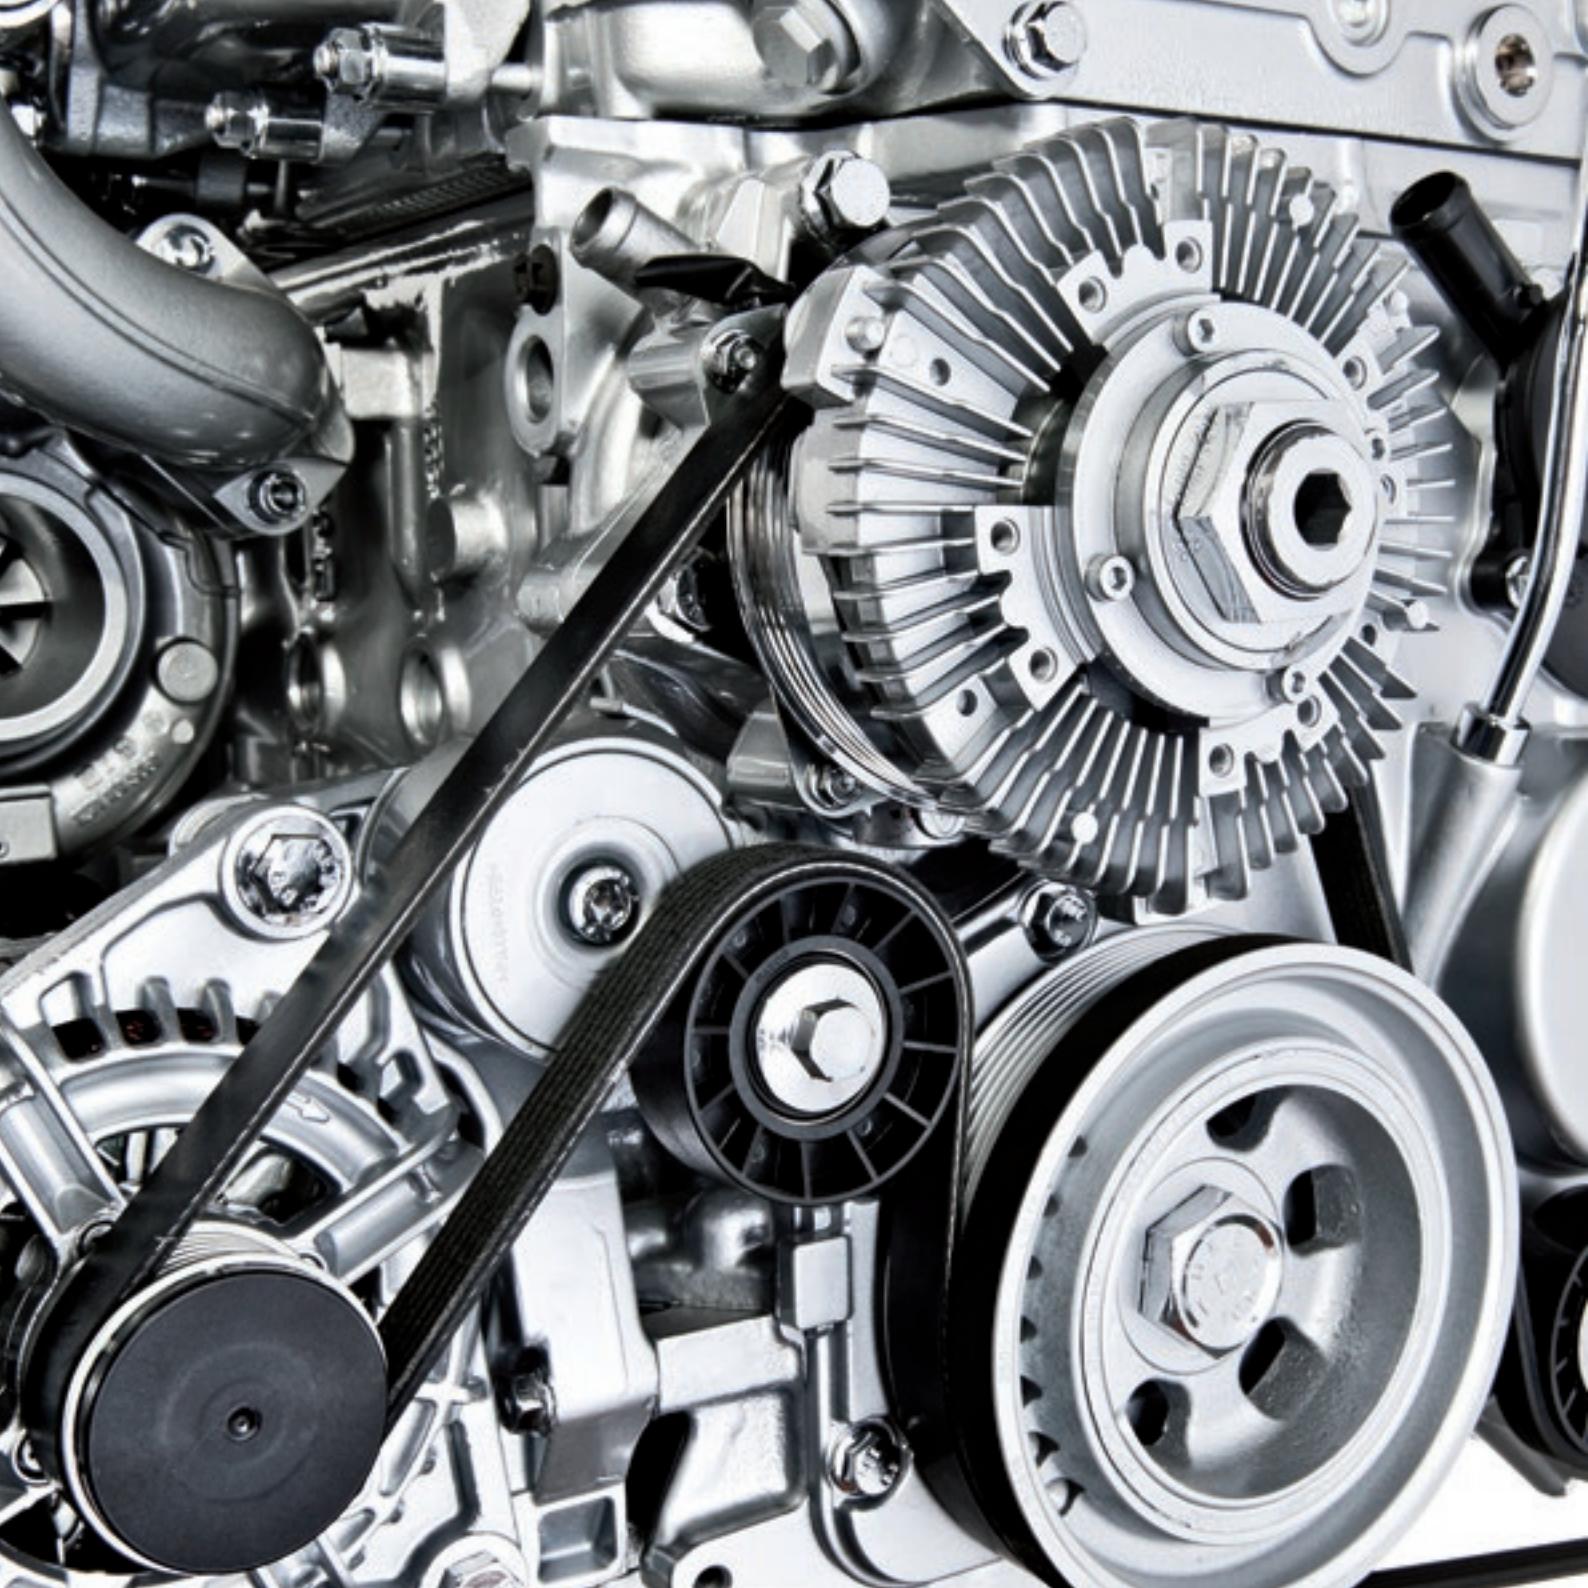

Thanks to lambda closed loop control and the use of a simple three way catalyst without EGR adoption, FPT natural gas engines are able to reduce the amount of pollutants (NO<sub>x</sub>, HC, CO) by 95%, complying Euro VI A/C emission requirements.

# Benefits

- ✓ REDUCED MAINTENANCE NEEDS AND OPERATING COSTS
- ✓ BEST IN CLASS FUEL CONSUMPTION AND PERFORMANCE LEADERSHIP
- ✓ BEST IN CLASS FUEL CONSUMPTION AND REDUCED NOISE
- ✓ VIBRATIONS & NOISE REDUCTION
- ✓ REDUCED OPERATING COSTS
- ✓ QUICK AND ACCURATE SERVICE SUPPORT REDUCED VEHICLE DOWNTIME
- ✓ SIMPLE ATS ARCHITECTURE TO REACH EMISSION LIMITS
